Retroactive male prolactin reference range comment removed

ISSUE:

Male prolactin reports from May 1, 2016, to January 11, 2017, contained premenopausal and postmenopausal female reference ranges in the comment field in addition to the male reference range of 2.0-13.0 pg/mL in the usual reference range field.

CORRECTION TAKEN:

Female reference range comment has been retroactively removed from the comment field on all male prolactin reports from May 1, 2016, to January 11, 2017. In addition, we have removed the automated addition of female reference ranges to the comment field on male prolactin tests effective January 11, 2017.
